Learning plan

What's my long-term goal?

My long-term goal is to be able to be able to build a project from beginning to the end, from back to front, so I may be able to create my own business.

I know right now I am not able to do it, and I want to improve my skills to be competitive and to prove myself that companies that did not want me in the first place will regret it.

What's my learning rhythm?

I want to dive deep in the training so I do not fix limits. I have moved back to my mother's flat so I can be 100% focused on the training and can work on it every day without a limit of time.

How will I handle frustrating moments?

I know programming can be hard, and frustrating, but my determination and a little help from time to time will, I hope, be enough to succeed. I know I can be almost brutal with myself, but that is how I push myself. If I have to work 15 hours a day, I will. If I am really stuck, I know I have some friends that could help me but I will not contact them until I know I am really in a dead-end. However, I am not shy to ask. I do not have a proud that could hold me back. It is just that I want to be sure that there are my efforts that lead me, not the others' knowledge.

I think following this training will make me able, by the end of the course, to:

- speak English most fluently than I do now. I hope I will be bilingual or close to it (at least C1).

- build a project for a client and answer easily to his needs

- keep me on date with new technologies that I could need

- help people that are willing to learn as I am, if they need me

- be independent at work
